Hypertension Canada's Blood Pressure Measurement (BPM) Device Recommendation Program

Hypertension Canada recommends that health care professionals, pharmacists, and the general public only use validated blood pressure monitors. Hypertension is highly sensitive to treatment, which underlines the importance of accurate blood pressure monitoring as it is vital to a patient's treatment and health. The BPM Device Recommendation Program helps patients and health care professionals easily differentiate between a validated unit that has been independently tested through a published clinical study in a reputable journal and reviewed by Hypertension Canada. A non-validated device's accuracy has not been proven, so Hypertension Canada cannot recommend its use.

To view the full validated list, reviewed by experts in international measurement standards, visit www.hypertension.ca

Most blood pressure monitors recommended by Hypertension Canada will have the following on the box and/or in material supplied with the device:
